DOES YOUR PUZZLE PIECE JUST NOT FIT?

Smith Magenis Syndrome is an under diagnosed syndrome. Common characteristics are:

- **Developmental Delay**
- **Flat midface, downturned mouth, prominent often rosy cheeks**
- **Low muscle tone (hypotonia)**
- **Early speech and motor delays**
- **Chronic sleep disturbance**
- **Maladaptive behaviors (hyperactivity, impulsivity, explosive outbursts, attention seeking, autistic-like/repetitive behaviors)**
- **Sensory integration issues**
- **May head bang, hit/bite self or pull fingernails off**
- **Happy disposition, sense of humor**
- **For more characteristics please visit www.prisms.org**

SMS is associated with a small missing piece of chromosome 17p11.2

There may be thousands of people who have SMS and do not have a diagnosis. Estimated to occur in 1/25000 births, the syndrome is vastly under diagnosed.
